ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

The licensee has had continual tooth issues and a ringworm problem in the facility since 2013 that was documented by the attending veterinarian in the treatment log. The veterinarian had requested multiple times that dental care be provided to the dogs, however the licensee failed to comply. There were 2 dogs with severe ringworm (#564 and #563) both F, Yorkie, blk/bro that had multiple patches of hair loss, resulting in thick skinned areas on the back and top of the head. The veterinarians treatment program are followed exactly as they are given. Failure to follow the veterinarians treatment program can lead to additional pain and discomfort for the animal, spreading of a contagious condition and the possibility of a treatable condition becoming chronic or even fatal depending on the issue.

It is important that all licensees follow their program of veterinary care as it is written by their attending veterinarian. The licensee must comply with the veterinarians directions on what treatments to provide, medicines, dosages and treatment regime in order to be in compliance with this regulation. The attending veterinarian can only assure proper treatment of the regulated animals if their guidelines and treatment program are followed exactly as they are given. Failure to follow the veterinarians treatment program can lead to additional pain and discomfort for the animal, spreading of a contagious condition and the possibility of a treatable condition becoming chronic or even fatal depending on the issue.

The licensee must follow the attending veterinarians treatment program as it is discussed and written at the time. Full dosages and treatment times must be adhered to and the primary veterinarian should be consulted if there are any problems or concerns during that time.

To be corrected: From this day forward

DIRECT NCI

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

There were multiple dogs with serious tooth issues in the facility that had not been treated by the veterinarian or owner. Throughout the inspection several dogs were identified with grade 3-4 (1-4 scale) of tarter buildup to the point of being in a solid row or where the teeth were unable to be seen at all,

Inspection Report

red/irritated gums with some drooling or loose and missing teeth. There were two dogs that had eye issues that need to be treated.

The dogs considered under a ***DIRECT*** are:

...#365, F, Yorkie, blk/bro, (9-10) with heavy drooling, 2 deformed molars, very loose almost fell out after examining mouth, heavy dark brown tarter on 2 canines, rest of the teeth are missing, red irritated gums.

...#375, M, Maltese white, (9-10) with large buildup of brown tarter, resulting in thick plates on all teeth where the tooth could not be seen on some.

...#315, M, Yorkie, blk/bro had heavy brown tarter on back molar with pus pocket between tooth and gums, gums were dark red and irritated. The nails were very long approximately 1 inch on some toes.

...#32, F, Maltese, white, several missing teeth with red/irritated gums, drooling, the right molar had cap of brown tarter on top and tooth moved easily when touched, almost fell out of mouth. Nails were long up to 1 inch on some toes.

...#203, F, Maltese, white had heavy brown tarter on canines with caps on the molars hiding the tooth. Pus pockets were located between gum line and tooth on left molar. Nails were up to 1 in length on most feet. Right eye had a lot of crusty material surrounding the eye, draining and weeping, the eye appeared to have a white spot or possible dry spot in the center and the eye appeared to buldge out more than the left. The eye was very red and irritated.

#323, F, Maltese, white, had both sides of molars completely encased in brown tarter, some drooling. The nails were long and began to curl under, up to 1 inch long.

...#310, F, Maltese, white had brown tarter covering molars and canines exposing the root on several teeth. There was a bulbous sore at the gum line of the right canine and a pus pocket between the gum and tooth of the right molar. The gums were red and irritated in some areas with drooling present.

...#496, F, Yorkie, blk/bro with bulbs of brown tarter buildup on all molars,

...#275, F, Chihuahua, bro/wht had buildup of tarter on canines and molars with some red on gums, and very long nails on front and back feet, some over 1 inch in length.

...#71, F, Maltese, white had brown tarter of brown tarter on canines and all molars

...#482, F, Yorkie, blk/bro, had both eyes surrounded by a thick crust of eye discharge and matter, resulting in red irritated eyes with some green mucus in the corners. Nails were long up to 1 inch.

The licensee has been aware of the teeth issues since at least October of 2013, however there has not been any veterinary care provided to work on any dental care issues in this facility. It was documented in the treatment log by the attending veterinarian since October 2013 that there were teeth issues that needed to be corrected, however the owner had not attended to this issue for any of the dogs. The nails had not been trimmed and are very long on the majority of dogs in the kennel with some up to 1 inch in length.

It is imperative that all regulated animals are checked daily for any injuries or health issues, and that regular monitoring of dental status is being conducted in order to prevent gum disease and heavy tarter buildup which can cause tooth problems, irritation and health issues. Any loose or broken teeth need to be treated according to the veterinarians direction as soon as possible in order to decrease the amount of

Inspection Report

pain and discomfort to the animal.

The licensee must maintain a program of dental care for all regulated animals under the direction of the veterinarian. If the veterinarian advises that dental care should be performed on the animals, the licensee must work with the veterinarian to provide that care.

During the inspection the licensee had the primary veterinarian treat 3 animals (#315, #32 and #365) that resulted in multiple teeth being pulled and scraping off of any tarter on the remaining teeth. #275 was looked at and the veterinarian wanted to give some time for a chlorhexidine treatment, before scraping the heavy tarter due to the damage it may cause at this time. The licensee is now starting a water/chlorhexidine program to assist with dental care.

The licensee must go through the entire facility and record the dental rating for all dogs and work with the veterinarian on a dental care program and show continual progress over time that the dogs teeth are being monitored and treated as needed.

3.1 (c) (3)

HOUSING FACILITIES, GENERAL.

The majority of the back walls, door flaps, and walk ways surrounding the doors of the 'Dry building' have an accumulation of brown grime and dirt that has not been cleaned from those surfaces. While the licensee does sanitize(once/2weeks) and clean the primary enclosures according to regulation on a daily basis, there is not proper scrubbing and cleaning of hard surfaces including the walls, door flaps and water pipes to rid them of the built up brown grime that accumulates over time.

The accumulation of grime and dirt on the hard surfaces of the primary enclosures can provide an area for disease, fungus and other health issues to survive and possibly infect or continue to infect the animals in the facility.

All surfaces that come in contact with the regulated animals must be kept clean and free of excess dirt and grime, as only those surfaces can be properly sanitized.
